In RV64I, registers are 64 bits, but instructions are still 32 bits. The term “word” generally refers to a 32-bit value. In RV64I, immediate shift instructions use 6-bit immediates: $uimm_{5:0}$; but for word shifts, the most significant bit of the shift amount ($uimm_5$) must be 0. Instructions ending in “w” (for “word”) operate on the lower half of the 64-bit registers. Sign- or zero-extension produces a 64-bit result.
